General Summary

This is a large high-quality natural area located in the Heart Lake Conservation Area is in good condition despite heavy recreational use. The area is biologically rich, with many habitat types and many species present, including a large number of rare species. The area consists largely of mature deciduous forest on the sandy hills and wetlands, part of the Heart Lake Provincially Significant Wetland Complex, between the hills. This area contains the only two natural lakes in the Etobicoke Creek watershed. Both lakes are hydrologically unusual for this region. The location of this natural area on the Brampton Esker sets it apart within this physiographic region and watershed.

This site is considered urban, although it is currently on the urban fringe, with older single-family residential development to the south and west. However, new residential development is underway to the north in the Town of Caledon, north of Mayfield Road, and future industrial/commercial development east of Heart Lake Road.

TRCA ELC surveyors, botanists and ornithologists have provided complete data coverage for the core NAI inventories (vegetation communities, plant species, breeding birds) plus incidental observations of other fauna over the delineated area (Table 1). TRCA ecologists have also surveyed frog species in this area.

Natural Feature Classifications and Planning Areas

This natural area is part of: Earth Science ANSI – regionally significant Brampton Buried Esker ESA – Heart Lake Woodlands ESA PSW – Heart Lake Wetland Complex

Physical Features

This area is in the South Slope physiographic region; characterized by low-lying ground moraines. At a more local scale, this natural area is situated on the north end of the Brampton Esker. The esker is a ridge of sand and gravel deposited by glacial meltwater during the final retreat of the Laurentide Ice Sheet (Natural Heritage Information Centre, 2010a; Wake, 1997). It is the only esker within the TRCA jurisdiction (Toronto and Region Conservation Authority, 2010a) and accounts for the steeply hilly topography of this site.

Heart Lake, the main hydrological feature of this area, is a 16.5 hectare kettle lake. The lake was formed 10,000 years ago after an ice block was severed from the retreating glacier and trapped within glacial till before finally melting. Teapot Lake, in the northeast corner of the area, is a 0.6 hectare kettle lake and also a meromictic lake (Natural Heritage Information Centre, 2010b). Meromictic lakes are unusual in that water from the upper and lower layers of the lake do not mix. Heart Lake and Teapot Lake are the only natural lakes in the Etobicoke Creek watershed (Ford, 2008; Toronto and Region Conservation Authority, 2010a; Wake, 1997).

These lakes drain into Etobicoke Creek. Soils of the South Slope region are generally poorly-draining clay loams, but in this area the coarse, permeable sands and gravels of the esker allow recharge to groundwater aquifers (Toronto and Region Conservation Authority, 2010a). Organic deposits have accumulated to substantial depths in the bog community located in a bay of Heart Lake (Ford, 2008).

Human History

The former community of Snelgrove was located nearby at the crossroads of Hurontario St. and Mayfield Road. John Snell, an Englishman, was an early settler who received a land grant of 100 acres in 1838. In its early days the community was known as Edmonton but was changed in 1895 due to confusion with Edmonton, Alberta. Hurontario St. was then, as now, a main route north into Caledon. By 1877, Snelgrove was a thriving community of 200 people and around 1878, the Credit Valley Railroad extended its rail-line to Snelgrove (Caledon Public Library, 2009; Corporation of the City of Brampton, 2010). Outside of Snelgrove, much of the general area was farmland from the 1800's well into the 1900's.

The property of Heart Lake Conservation Area was acquired in the 1950's and the conservation area was opened to the public in 1957 (Toronto and Region Conservation Authority, 2010b). Parts of the conservation area have been reforested and these plantations are not likely older than 50 years.

The conservation area is popular for a variety of recreational activities year-round. Heart Lake is stocked with fish for recreational fishing and there are boat rentals available. There are more than

eight kilometres of hiking trails and a number of picnicking areas. Cross-country skiing and skating are available in the winter (Toronto and Region Conservation Authority, 2010b; Wake, 1997).

According to W.P. Bull, an early historian, Heart Lake was once owned by a Colonel A.E. Taylor (circa 1938). Of historic interest, Taylor reported occasionally seeing sulphur-coloured water spurting out of the lake up to fifteen feet or more in moving columns. Taylor and other locals attributed this hydrological phenomenon to a "sea serpent" (Bull, 1938).

This natural area is bordered on the north and east by roads. To the west and south, the surrounding land use is predominantly single-family housing subdivisions. This area of Brampton was developed over the last few decades and much of the land was previously farmland.

Vegetation Communities

The general community types present here are coniferous forest (0.3%), deciduous forest (37%), mixed forest (2%), shrub bog (0.5%), treed bog (0.1%), meadow marsh (2%), shallow marsh (4%), deciduous swamp (12%), mixed swamp (1%), thicket swamp (5%), submerged shallow aquatic (3%), mixed shallow aquatic (2%), open aquatic (8%), cultural meadow (4%), cultural thicket (5%), cultural woodland (2%) and plantation (13%).

One-hundred-and-forty-five plant communities were mapped for this area, belonging to 64 different vegetation types (Table 2). Six of the vegetation types are provincially rare: Fresh-Moist Black Walnut Lowland Deciduous Forest (FOD7-4, S-rank S2S3), Leatherleaf Shrub Kettle Bog (BOS2-1, S-rank S3), Tamarack - Leatherleaf Treed Kettle Bog (BOT2-1, S-rank S3), Red Maple - Conifer Organic Mixed Swamp (SWM5-1, S-rank S3S4), Silky Dogwood Mineral Thicket Swamp (SWT2-8, S-rank S3S4) and Winterberry Organic Thicket Swamp (SWT3-7, S-rank S3S4). The Fresh-Moist Sugar Maple - Hemlock Mixed Forest (FOM6-1) community and both bog communities are regionally rare.

Twenty-two of the community types are considered to be TRCA regional Communities of Conservation Concern: Fresh-Moist Oak - Sugar Maple Deciduous Forest (FOD9-1, L-rank L3), Dry-Fresh Hardwood Hemlock Mixed Forest (FOM3-1, L-rank L3), Dry-Fresh Paper Birch Mixed Forest (FOM5-1, L-rank L3), Leatherleaf Shrub Kettle Bog (BOS2-1, L-rank L1), Tamarack - Leatherleaf Treed Kettle Bog (BOT2-1, L-rank L1), Broad-leaved Sedge Organic Meadow Marsh (MAM3-6, L-rank L2), Jewelweed Organic Meadow Marsh (MAM3-8, L-rank L3), Forb Organic Meadow Marsh (MAM3-9, L-rank L3), Swamp Loosestrife Organic Shallow Marsh (MAS3-12, L-rank L2), Broad-leaved Cattail Organic Shallow Marsh (MAS3-1A, L-rank L3), Red Maple Mineral Deciduous Swamp (SWD3-1, L-rank L3), Red Maple Organic Deciduous Swamp (SWD6-1, L-rank L2), Silver Maple Organic Deciduous Swamp (SWD6-2, L-rank L2), Swamp Maple Organic Deciduous Swamp (SWD6-3, L-rank L3), Red Maple - Conifer Organic Mixed Swamp (SWM5-1, L-rank L2), Silky Dogwood Mineral Thicket Swamp (SWT2-8, L-rank L3), Alder Organic Thicket Swamp (SWT3-1, L-rank L3), Willow Organic Thicket Swamp (SWT3-2, L-rank L3), Winterberry Organic Thicket Swamp (SWT3-7, L-rank L2), Spiraea Organic Thicket Swamp (SWT3-A, L-rank L2), Duckweed Mixed Shallow Aquatic (SAM1-2, L-rank L3) and Water Lily - Bullhead Lily Mixed Shallow Aquatic (SAM1-A, L-rank L3).

An additional 16 community types are TRCA regional Communities of Urban Conservation Concern: Fresh-Moist Hemlock Coniferous Forest (FOC 3-1, L-rank L4), Dry-Fresh Oak - Hardwood Deciduous Forest (FOD2-4, L-rank L4), Dry-Fresh Poplar Deciduous Forest (FOD3-1, L-rank L4), Dry-Fresh Paper Birch Deciduous Forest (FOD3-2, L-rank L4), Dry-Fresh Sugar Maple - Oak Deciduous Forest (FOD5-3, L-rank L4), Dry-Fresh Sugar Maple - Red Maple Deciduous Forest (FOD5-9, L-rank L4), Dry-Fresh Sugar Maple - Paper Birch - Poplar Deciduous Forest (FOD5-10, L-rank L4), Fresh-Moist Black Walnut Lowland Deciduous Forest (FOD7-4, L-rank L4), Fresh-Moist Paper Birch Deciduous Forest (FOD8-B, L-rank L4), Fresh-Moist Sugar Maple - Hemlock Mixed Forest (FOM6-1, L-rank L4), Broad-leaved Sedge Mineral Meadow Marsh (MAM2-6, L-rank L4), Broad-leaved Cattail Mineral Shallow Marsh (MAS2-1A, L-rank L4), Alder Mineral Thicket Swamp (SWT2-1, L-rank L4) and Red-

osier Mineral Thicket Swamp (SWT2-5, L-rank L4), Silky Dogwood Deciduous Thicket (CUT1-F, L-rank L4) and Grey Dogwood Deciduous Thicket (CUP1-4, L-rank L4).

^{*} Note: The map reference code refers to the vegetation type shown on mapping for this area and also to the Appendix list of species typically encountered in this vegetation type.

Species Presence

Vascular Plants

Plant species diversity is high in this natural area. A total of 371 species of vascular plants are present, of which 287 (77%) are native. One species, Butternut (*Juglans cinerea*) is Endangered both nationally and provincially, as well as being provincially rare (S-rank S3?; Table 3). Forty-two of the species are regionally rare (Table 4). Ninety-nine species are TRCA regional Species of Conservation

Concern and an additional 72 species are TRCA regional Species of Urban Conservation Concern (Table 4).

Breeding Birds

A total of 70 species of breeding birds have been observed at this natural area, of which 68 (97%) are native. One of these, Barn Swallow (*Hirundo rustica*), is Threatened nationally (Table 3). Eighteen of the breeding bird species are TRCA regional Species of Conservation Concern and an additional 26 species are TRCA regional Species of Urban Conservation Concern (Table 4).

Four species of colonial-nesting birds, Barn Swallow, Northern Rough-winged Swallow (Stelgidopteryx serripennis), Great Blue Heron (Ardea herodias) and Marsh Wren (Cistothorus palustris), breed in this area. The interior forest habitat provided at this site supports five species of area-sensitive forest interior birds, namely Brown Creeper (Certhia americana), Black-throated Green Warbler (Dendroica virens), Hairy Woodpecker (Picoides villosus), Pileated Woodpecker (Dryocopus pileatus) and Red-breasted Nuthatch (Sitta canadensis). The large patches of open successional habitat support the breeding of four grassland bird species, namely Brown Thrasher (Toxostoma rufum), Eastern Kingbird (Tyrannus tyrannus), Savannah Sparrow (Passerculus sandwichensis) and Willow Flycatcher (Empidonax traillii), one of which (Savannah Sparrow) is area-sensitive. The numerous wetlands at this site support breeding of Wood Duck (Aix sponsa), Mallard (Anas platyrhynchos), Marsh Wren, Sora (Porzana carolina) and Virginia Rail (Rallus limicola). Three raptor species, Cooper's Hawk (Accipiter cooperii), Sharp-shinned Hawk (Accipiter striatus) and Long-eared Owl (Asio otus), also use this area.

Long-eared Owl use conifer plantation habitat patches in this area as winter roosts (D. Renfrew, pers. comm., 2010).

Fish

At least ten species of fish are known from this natural area.

<u>Herpetofauna</u>

This natural area is rich in herpetofaunal species. Eight species of amphibians and five species of reptiles, all native, occur in this area. Two species, Eastern Snapping Turtle (*Chelydra serpentina*) and Eastern Milksnake (*Lampropeltis triangulum triangulum*), are designated Special Concern both nationally and provincially (Table 3). Both Eastern Snapping Turtle and Eastern Milksnake are also provincially rare, both having S-ranks of S3. Nine of the herpetofaunal species are TRCA regional Species of Conservation Concern and an additional four species are TRCA regional Species of Urban Conservation Concern (Table 4).

Although not found during fieldwork, W.P. Bull (1938) cites a historical record of a Bullfrog (*Rana catesbeiana*) from Heart Lake.

Midland Painted Turtles (*Chrysemys picta marginata*) and Eastern Snapping Turtles use the kettle lakes and breed on surrounding land. Wood Frogs (*Rana sylvatica*) and Spring Peepers (*Pseudacris crucifer*) breed in the wetlands and also use adjacent upland forests (Natural Heritage Information Centre, 2010b).

Mammals

Ten mammal species have been observed incidentally to occur in this area, all of which are native and common. One of the mammal species is a TRCA regional Species of Conservation Concern and an additional seven species are TRCA regional Species of Urban Conservation Concern (Table 4).

Site Condition and Disturbances

Historically, over half of the Brampton Esker was mined for gravel, to the south of Heart Lake Conservation Area. This resulted in the loss of a number of kettle wetlands and bogs to the south, and some impacts within Heart Lake CA (Natural Heritage Information Centre, 2010a).

There has been some water quality deterioration within Heart Lake CA as indicated by algal blooms and an altered plant composition. This may be due to run-off from nearby developed land and/or a large Canada Goose (*Branta canadensis*) population in the area. The kettle lakes are quite susceptible to water quality issues because of their small catchment area and low turnover rates. The bogs which have low nutrient levels are particularly susceptible (*ibid*).

Light to moderate disturbance resulting from trails occurs in some of the forest and cultural communities. Trail disturbance is minimal in the wetland communities. Light flooding is present in a few marsh and swamp communities. Trash/dumping is light to severe throughout with light disturbance being the norm. The more impacted areas are near recreational parts and on the west side of the park adjacent to residential land use. Disturbance from exotic species ranges from light to severe. Invasive species are more extensive at the south end of the site, especially around recreational areas and along the west edge of the area behind residences. Age of the treed communities ranges from pioneer to mature. Mature forest occurs in a band around the east side of Heart Lake, and to the south of Heart Lake. There is a large mature Swamp Maple deciduous swamp in the north end of this natural area.

Ecological Features and Functions

Heart Lake Woodlands ESA is included in this area. The wetlands of this natural area are part of the provincially significant Heart Lake Wetland Complex. This area is included in the regionally significant Brampton Buried Esker Earth Science ANSI.

With forest communities greater than 2 ha and wetlands over 0.5 ha in size, this natural area has the potential to support and sustain biodiversity, healthy ecosystem functions and to provide long-term resilience for the natural system.

Heart Lake and Teapot Lake are the only two natural lakes in the Etobicoke Creek watershed. In addition, both are kettle lakes, and one (Teapot) is also a meromictic lake.

By containing a very wide variety of habitat types, this natural area supports biodiversity, particularly for species that require more than one habitat type for their life needs. This natural area contains provincially and regionally rare vegetation communities and thus has the potential to support additional biodiversity above and beyond that found in common community types.

A wetland and a successional area occur to the north across Mayfield Road and also to the east across Heart Lake Road. The relatively close proximity of other areas of natural habitat creates above-average potential for wildlife movement between natural areas, species dispersal and recovery from disturbance, which all create additional resilience for the ecosystem.

A tributary of Etobicoke Creek passes through this area and thus this natural area supports the connectivity function of Etobicoke Creek and its tributaries which provide a natural habitat corridor that facilitates the cross-regional movement of wildlife along this corridor between major provincial corridors.

This is an area of groundwater recharge (Natural Heritage Information Centre, 2010b).

This area contains six provincially rare vegetation types and three regionally rare vegetation types.

This area provides habitat for four Species At Risk (one plant species, one bird species, two herpetofaunal species).

This area supports three provincially rare species (one plant species, one turtle species, one snake species) and 42 regionally rare vascular plant species.

This natural area supports the breeding of four species of colonial-nesting birds, five species of areasensitive forest interior birds, two species of waterfowl, three species of wetland nesting birds and three raptor species. The area also supports four species of grassland birds, of which one is areasensitive.

This area supports amphibian breeding, with eight amphibian species breeding in the wetlands of this site. This area supports turtle breeding.

Based on the above features, this area should be evaluated to determine if significant wildlife habitat is present in accordance with the Provincial Policy Statement, Region of Peel Official Plan, and Brampton Official Plan.

As a community that is capable of high mast (nut) production, the Fresh-Moist Oak - Sugar Maple Deciduous Forest (FOD9-1) communities are an importance source of food for a variety of fauna species

Wetlands within this natural area are used regularly by school groups and naturalists for environmental education and nature appreciation.

Opportunities

This natural area has so many special features that finding a balance between protection of this high-quality area and responding to high interest in recreational use of the area will be an ongoing challenge. It does however, offer good opportunity to dispense educational messaging on environmental issues and protection practices.

Existing linkages to other natural areas should be maintained.

The distribution and extent of invasive species could be mapped and monitored. This is especially important near recreational areas, along trails and behind residences which can serve as their entry points into a natural area. Control of invasive species might be considered.

Parts of this area adjacent to residential developments should be monitored for dumping of yard waste and trash and encroachment into the natural area.

The health of the Butternut tree(s) on site could be assessed by a Butternut Assessor to determine whether any might be candidates for inclusion in the Butternut Recovery Program.

Additional inventories of dragonflies/damselflies, butterflies and small mammals would likely be productive given the high biodiversity of other surveyed taxa.

There is a significant potential for wildlife road mortality as this natural area bordered by busy roads in an increasingly urbanized area. A road ecology assessment of the extent of wildlife mortality on Heart Lake Road is being undertaken by the TRCA in conjunction with the Toronto Zoo, the Etobicoke-Mimico Watershed Alliance and local volunteers in 2011. This project has the potential to reveal if and where measures to mitigate against this mortality might be taken (e.g. constructed crossings and signage), may be warranted.

Since some of the forest communities are mature, they should be checked for characteristics of old growth, which may be considered a significant habitat feature.
